## IOT

### Blinking LED

```
int led = 5;
void setup() {
  pinMode(led, OUTPUT);
}
void loop() {
  digitalWrite(led, HIGH);
  delay(1000);
  digitalWrite(led, LOW);
  delay(1000);
}
```

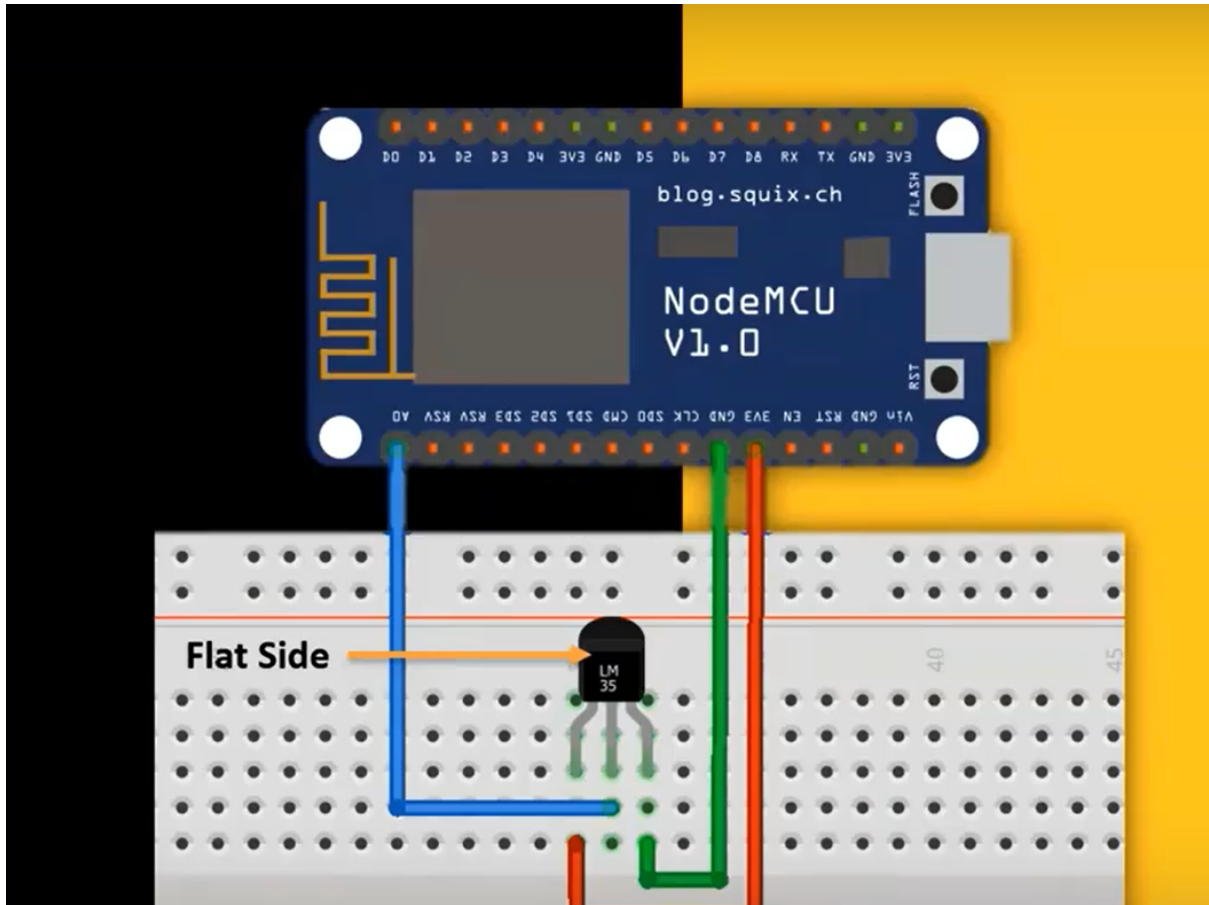

The shorter one, and it should be connected to the ground. The longer part of the LED is the positive lead, and it should be connected to the positive voltage source. The bent part of the LED is connected to the cathode of the diode, which is the negative side. The longer part of the LED is connected to the anode of the diode, which is the positive side.

## Temperature Sensor

```
int inputpin = A0;
void setup() { Serial.begin(9600); }
void loop() // main loop
{
    int analogValue = analogRead(inputpin);
    float millivolts = (analogValue / 1024.0) * 3300;
    float celsius = millivolts / 10;
    Serial.print("in DegreeC= ");
    Serial.println(celsius);
    //-----Calculation for Fahrenheit -----//
    float fahrenheit = ((celsius * 9) / 5 + 32);
    Serial.print(" in Farenheit = ");
    Serial.println(fahrenheit);
    delay(1000);
}
```

# IR Sensor Using NodeMCU

```
int ledPin = 12; // choose pin for the LED
int inputPin = 13; // choose input pin (for Infrared sensor)
int val = 0; // variable for reading the pin status

void setup() {
    pinMode(ledPin, OUTPUT); // declare LED as output
    pinMode(inputPin, INPUT); // declare Infrared sensor as input
}

void loop() {
    val = digitalRead(inputPin); // read input value
    if (val == HIGH) { // check if the input is HIGH
        digitalWrite(ledPin, LOW); // turn LED OFF
    } else {
        digitalWrite(ledPin, HIGH); // turn LED ON }
    }
}
```

## IR Sensor

## Light Sensor

```
void setup() { Serial.begin(9600); }  
void loop() {  
    int sensorValue = analogRead(A0); // read the input on analog pin 0  
    float voltage = sensorValue * (5.0 / 1023.0);  
    // Convert the analog reading (which goes from 0 - 1023) to a voltage (0 - 5V)  
    Serial.println(voltage); // print out the value you read  
}
```

## Proximity Detection

```
// Code 1: Digital input
void setup() {
  pinMode(D6, OUTPUT); // trigger pin
  pinMode(D7, INPUT); // Echopin
}

void loop() {
  digitalWrite(D6, LOW);
  delayMicroseconds(2);
  digitalWrite(D6, HIGH);
  delayMicroseconds(10);

  long duration = pulseIn(D7, HIGH);
  long distance = duration * 0.034 / 2;
  Serial.print("Distance: ");
  Serial.println(distance);
  delay(1000);
}
```

```

}

// code 2: Analog input

const int trigPin = 5;
const int echoPin = 6;
long duration;
int distanceCm, distanceInch;

void setup() {
  pinMode(trigPin, OUTPUT);
  pinMode(echoPin, INPUT);
  Serial.begin(9600);
}

void loop() {
  digitalWrite(trigPin, LOW);
  delayMicroseconds(2);
  digitalWrite(trigPin, HIGH);
  delayMicroseconds(10);
  digitalWrite(trigPin, LOW);
  duration = pulseIn(echoPin, HIGH);
  distanceCm = duration * 0.034 / 2;
  distanceInch = duration * 0.0133 / 2;
  Serial.print("Distance: ");
  Serial.print(distanceCm);
  Serial.print("cm");
  Serial.print("Distance: ");
  Serial.print(distanceInch);
  Serial.print("inch");
  delay(1000);
}

```

Nodemcu ESP 8266

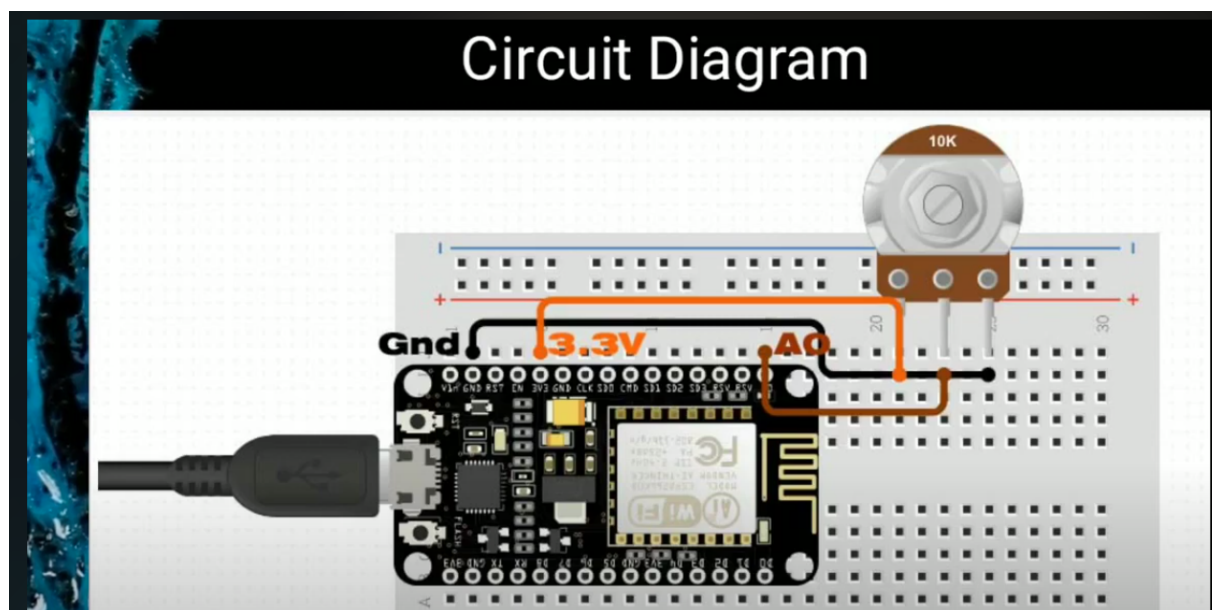

Ultrasonic Sensor

fritzing

## Servo

```
#include <Servo.h>
Servo newservo1;
void setup() { // put your setup code here, to run once:
  newservo1.attach(D6);
}
void loop() { // put your main code here, to run repeatedly:
  newservo1.write(180);
  delay(1000);
  newservo1.write(0);
  delay(1000);
}
// red wire to 5V
// black wire to GND
// orange or white wire to d6
```

## Potential + Servo

```
#include <Servo.h>
Servo newservo1;

void setup() {
  newservo1.attach(D6);
  Serial.begin(9600);
  pinMode(A0, INPUT);
}

void loop() {
  float x = analogRead(A0);
  x = map(x, 0, 1023, 0, 180);
  newservo1.write(x);
  delay(1000);
}
```
